

Polyurethane Tension screens directly replace metallic meshes without having to modify or adapt the machine. They are built with metallic cable reinforcement to absorb the tension, increasing the polyurethane's resistance to strain and load.

- Flexible polyurethane:

Polyurethane Tension screens with a formulation that adds flexibility, essential attribute when screening materials that build-up on screen surface, peg or wedge.

- Standard monolayer polyurethane (single layer):

For all basic needs in screening we use our standard monolayer polyurethane, this is the same hardness through-out the PU panel.

- Bishore polyurethane (double layered):

For special applications where soft PU is used on screening surface, to withstand the abrasion and hard PU to withstand impact and load.

- Side tension meshes:

With metallic cable reinforcement to withstand the tension from the side tension hooks, perpendicular to the material flow.

- End tension meshes:

With metallic cable reinforcement to withstand the tension from the end tension hooks, parallel to the material flow.
